# Urban SOUND Planning

Obtaining a good acoustic quality in urban areas is a major environmental task within the European Union that goes far beyond noise control – a task that requires a comprehensive view on the future development of cities including their transport and industrial infrastructure.

The aim of **Urban SOUND Planning** is to achieve the best possible solution when designing an acoustically favorable environment. To cope with the complexity of this task, consequent application of a transdisciplinary approach is needed: Urban and traffic planning, architectural aspects, noise control, and soundscaping, as well as political and administrative processes and economic aspects, must be considered early in the planning stages. Also, the affected members of the public must be adequately involved in the planning.

The international symposium **Urban SOUND Planning** for city representatives, planners, and all stakeholders involved in urban planning will present new tools developed within the EU-funded SONORUS project to actively design livable cities, as well as their practical application to specific test cases provided by the project's city partners Gothenburg, Antwerp, Brighton, and Rome.

The **Urban SOUND Planning** symposium will be preceded by the autumn meeting of the EURO CITIES' Working Group Noise (WGN) that will take place on September 14./15. 2016 in Munich.

The presentations will be held in English.

Further information as well as the detailed program can be found at [www.fp7sonorus.eu](http://www.fp7sonorus.eu) and at [www.muellerbbm.com/events/seminars-and-workshops/urban-sound-planning/](http://www.muellerbbm.com/events/seminars-and-workshops/urban-sound-planning/)
